

Lean Manufacturing

Raw Material Storage

Production Area

Finished Goods Storage

Keep your Manufacturing flowing

Manufacturing sits at the heart of most things we buy or consume and the process can sometimes be complex. The need for efficient storage solutions is a common challenge, whether you are manufacturing in the Pharmaceutical, Engineering, Electrical, Automotive, Clothing or Food industry. Common challenges for our Manufacturing customers are:

- Holding stock for JIT supply of materials to production areas
- Ensuring correct raw materials or components are in the right place at the right time
- Longer term storage of bulk stock items
- Storing items of different sizes and weight
- Smooth transfer of stock to manufacturing area
- Optimum material handling
- Batch control and traceability
- Improve ergonomics of production areas
- Secure storage of specialist tools, equipment or spare machine parts
- Inefficient product handling removes any benefit of improved production rates

Manufacturing activity is often a multi stage process so the storage problems rarely have a single solution. Different stages of the process may require different storage methods, which combined, create a well organised operation.

The overall aim is to reduce error rate, improve ergonomics and work flow, maintain optimum productivity levels and in general have a well organised environment for each processing stage.
